

# Prolog Libraries

- Constraint Logic Programming
- Solving Sudoku
- Solving Cryptarithmic puzzle, etc

## Constraint Logic Programming

- CLP is a useful paradigm for formulating and solving problems that can be naturally defined in terms of constraints among a set of variables.
- CLP combines *constraint satisfaction* approach with logic programming.
- **CLP(X)** stands for constraint logic programming over the **domain X**.
- There are dedicated constraint solvers for several important domains:
  - CLP(FD) for **integers** ([section A.9](#))
  - CLP(B) for **Boolean** variables ([section A.8](#))
  - CLP(Q) for **rational** numbers ([section A.10](#))
  - CLP(R) for **floating point** numbers ([section A.10](#))
- CLP is most preferably used to solve problems that consist of finding combinations of values of variables that satisfy a set of constraints.

## Constraint Satisfaction

- A constraint satisfaction problem is stated as follows:
- Given:
  - A set of variables
  - The domains from which variables can take values,
  - Constraints that the variables have to satisfy
- Find:
  - An assignment of values to the variables, so that these values satisfy all given constraints.
- Constraint satisfaction is a two-step process.
  - constraints are discovered and propagated as far as possible throughout the system.
  - then if there is still not a solution, search begins. A guess about something is made and added as a new constraint. Propagation can then occur with this new constraint, and so forth.
- Constraint propagation terminates for one of two reasons:
  - A contradiction may be detected
  - The propagation has run out of steam and there are no further changes that can be made on the basis of current knowledge.
- **A general rule: the more powerful the rules for propagating constraints, the less need there is for guessing.**

## A SCHEDULING PROBLEM

- tasks a, b, c, d
- durations 2, 3, 5, 4 hours respectively
- precedence constraints
- **Constraints:**

$$0 \leq T_a$$

$$T_a + 2 \leq T_b$$

$$T_a + 2 \leq T_c$$

$$T_b + 3 \leq T_d$$

$$T_c + 5 \leq T_f$$

$$T_d + 4 \leq T_f$$

## CORRESPONDING CONSTRAINT SATISFACTION PROBLEM

- **Variables:**  $Ta, Tb, Tc, Td, Tf$
- **Domains:** All variables are non-negative real numbers
- **Constraints:**
  - $0 \leq Ta$  (task  $a$  cannot start before 0)
  - $Ta + 2 \leq Tb$  (task  $a$  which takes 2 hours precedes  $b$ )
  - $Ta + 2 \leq Tc$  ( $a$  precedes  $c$ )
  - $Tb + 3 \leq Td$  ( $b$  precedes  $d$ )
  - $Tc + 5 \leq Tf$  ( $c$  finished by  $Tf$ )
  - $Td + 4 \leq Tf$  ( $d$  finished by  $Tf$ )
- **Criterion:** minimise  $Tf$

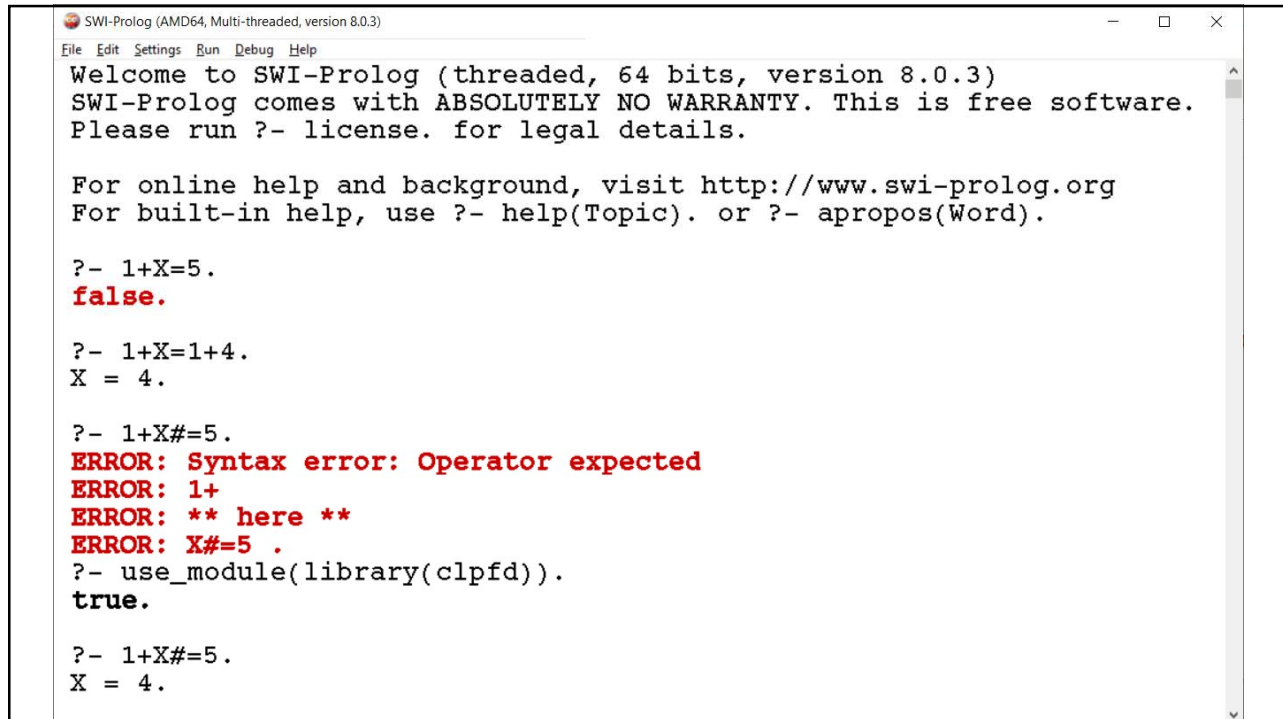

## CLP over finite domains: CLP(FD)query format

- In CLP(FD) query, domains of variables are sets of integers.
- For example: the query  $1+X=5$  fails with answer false/no.
 

$?- 1+X=5.$ 
% false
- This is how we turn it into CLP query:
 

$?-1+X \# = 5.$ 
% X = 4
- This is another way of posing this same query:
 

$?-\{1+X=5\}.$ 
%X=4
- But before using this CLP query, clpfd library must be used at the command prompt.

```
SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)

?- 1+X=5.
false.

?- 1+X=1+4.
X = 4.

?- 1+X#=5.
ERROR: Syntax error: Operator expected
ERROR: 1+
ERROR: ** here **
ERROR: X#=5 .
?- use_module(library(clpfd)).
true.

?- 1+X#=5.
X = 4.
```

## APPLICATIONS OF CLP

- scheduling
- logistics
- resource management in production, transportation, placement

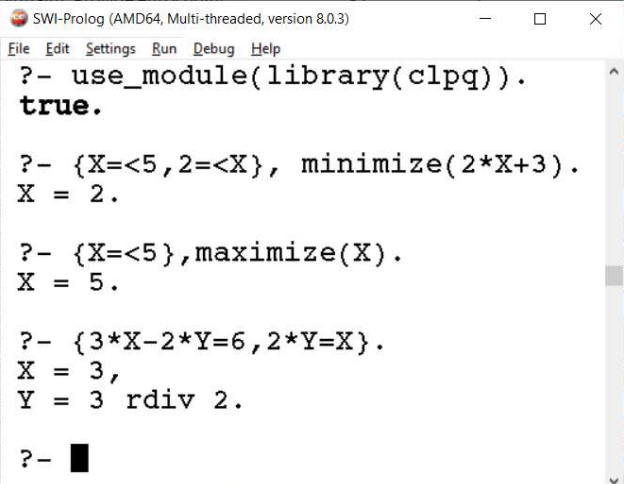

## APPLICATIONS OF CLP

Typical applications involve assigning resources to activities

- machines to jobs,
- people to rosters,
- crew to trains or planes,
- doctors and nurses to duties and wards

- **clpq** library for handling constraints over the rational numbers
- **clpr** library for handling constraints over the real numbers (using floating point numbers as representation).
- `{}`(list of Constraints separated by comma)
  - Adds the constraints given by Constraints to the constraint store.
- `minimize(Expression)`
  - Minimizes Expression within the current constraint store. This is the same as computing the infimum and equating the expression to that infimum.
- `maximize(Expression)`
  - Maximizes Expression within the current constraint store. This is the same as computing the supremum and equating the expression to that supremum.

`use_module(library(clpq))`

```

SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)
File Edit Settings Run Debug Help
?- use_module(library(clpq)).
true.

?- {X=<5, 2=<X}, minimize(2*X+3).
X = 2.

?- {X=<5}, maximize(X).
X = 5.

?- {3*X-2*Y=6, 2*Y=X}.
X = 3,
Y = 3 rdiv 2.

?- 

```

Source: <https://www.swi-prolog.org/pldoc/man?section=clpqr>

## clpq: CLP OVER RATIONAL NUMBERS

- Real numbers represented as quotients between integers
- Example:  
`?- { X = 2*Y, Y = 1-X }.`
- A CLP(Q) solver gives:  
**`X = 2/3, Y = 1/3`**
- A CLP(R) solver gives something like:  
**`X = 0.666666666, Y = 0.333333333`**

## LINEAR OPTIMISATION FACILITY

```
?- {X >=2, Y >=2, Y <= X+1, 2*Y <= 8-X, Z = 2*X +3*Y},
    maximize(Z).
```

```
X = 4.0
```

```
Y = 2.0
```

```
Z = 14.0
```

```
?- { X <= 5}, minimize( X).  no
```

## SIMPLE SCHEDULING

?- {  $T_a + 2 \leq T_b$ ,      % a precedes b  
       $T_a + 2 \leq T_c$ ,      % a precedes c  
       $T_b + 3 \leq T_d$ ,      % b precedes d  
       $T_c + 5 \leq T_f$ ,      % c finished by finishing time  $T_f$   
       $T_d + 4 \leq T_f$ },      % d finished by  $T_f$   
      minimize(  $T_f$ ).

$T_a = 0.0$ ,  $T_b = 2.0$ ,  $T_d = 5.0$ ,  $T_f = 9.0$

{ $T_c \leq 4.0$ }

{ $T_c \geq 2.0$ }

## Application areas of CLP(FD)

- There are two major use cases of CLP(FD) constraints:
  - **declarative integer arithmetic** ([section A.9.3](#))
  - solving **combinatorial problems** such as planning, scheduling and allocation tasks.
- The predicates of this library can be classified as:
  - *arithmetic* constraints like `#=` /2, `#>` /2 and `#\=` /2 ([section A.9.17.1](#))
  - the *membership* constraints `in` /2 and `ins` /2 ([section A.9.17.2](#))
  - the *enumeration* predicates `indomain` /1, `label` /1 and `labeling` /2 ([section A.9.17.3](#))

## Arithmetic constraints in clpfd

- In total, the arithmetic constraints are:

$\text{Expr1} \# = \text{Expr2}$	Expr1 equals Expr2
$\text{Expr1} \# \neq \text{Expr2}$	Expr1 is not equal to Expr2
$\text{Expr1} \# \geq \text{Expr2}$	Expr1 is greater than or equal to Expr2
$\text{Expr1} \# \leq \text{Expr2}$	Expr1 is less than or equal to Expr2
$\text{Expr1} \# > \text{Expr2}$	Expr1 is greater than Expr2
$\text{Expr1} \# < \text{Expr2}$	Expr1 is less than Expr2

## Arithmetic Expressions with clpfd

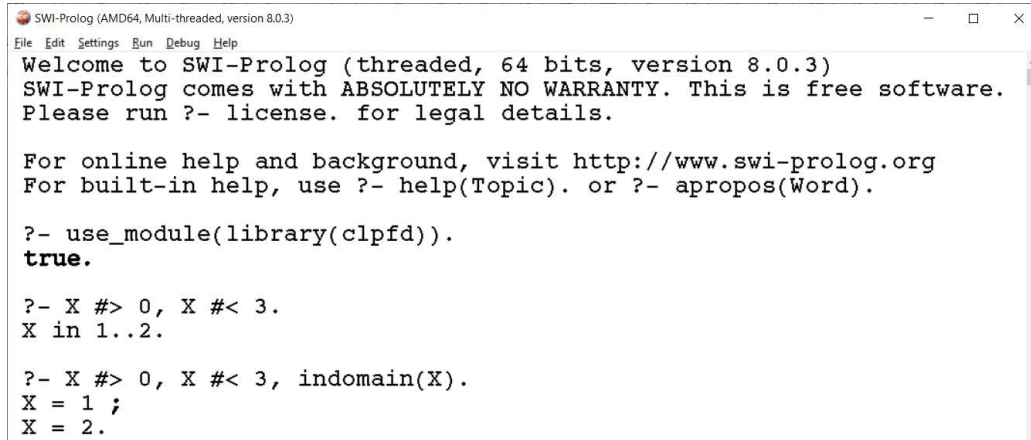

- $\text{Expr1}$  and  $\text{Expr2}$  denote **arithmetic expressions**, which are:  
 where  $\text{Expr}$  again denotes an arithmetic expression  
 bitwise operations  $(\backslash) / 1$ ,  $(/\backslash) / 2$ ,  $(\backslash \backslash) / 2$ ,  $(>>) / 2$ ,  $(<<) / 2$ ,  $\text{lsb} / 1$ ,  $\text{msb} / 1$ ,  $\text{popcount} / 1$  and  $(\text{xor}) / 2$  are also supported.

<i>integer</i>	Given value	$\# \backslash Q$	True iff Q is false
<i>variable</i>	Unknown integer	$P \# \vee Q$	True iff either P or Q
$?(\text{variable})$	Unknown integer	$P \# \wedge Q$	True iff both P and Q
$-\text{Expr}$	Unary minus	$P \# \backslash Q$	True iff either P or Q, but not both
$\text{Expr} + \text{Expr}$	Addition	$P \# \iff Q$	True iff P and Q are equivalent
$\text{Expr} * \text{Expr}$	Multiplication	$Q$	
$\text{Expr} - \text{Expr}$	Subtraction	$P \# \implies Q$	True iff P implies Q
$\text{Expr} ^ \text{Expr}$	Exponentiation	$P \# \impliedby Q$	True iff Q implies P
$\text{min}(\text{Expr}, \text{Expr})$	Minimum of two expressions	-here P and Q are Boolean values. -When reasoning over Boolean variables, also consider using CLP(B) constraints as provided by library(clpb).	
$\text{max}(\text{Expr}, \text{Expr})$	Maximum of two expressions		
$\text{Expr} \bmod \text{Expr}$	Modulo induced by floored division		
$\text{Expr} \text{ rem } \text{Expr}$	Modulo induced by truncated division		
$\text{abs}(\text{Expr})$	Absolute value		
$\text{Expr} // \text{Expr}$	Truncated integer division		
$\text{Expr} \text{ div } \text{Expr}$	Floored integer division		

## indomain (enumeration predicate)

- Built-in predicate **indomain(X)** assigns through backtracking all possible values to X.

```

SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)
File Edit Settings Run Debug Help
Welcome to SWI-Prolog (threaded, 64 bits, version 8.0.3)
SWI-Prolog comes with ABSOLUTELY NO WARRANTY. This is free software.
Please run ?- license. for legal details.

For online help and background, visit http://www.swi-prolog.org
For built-in help, use ?- help(Topic). or ?- apropos(Word).

?- use_module(library(clpfd)).
true.

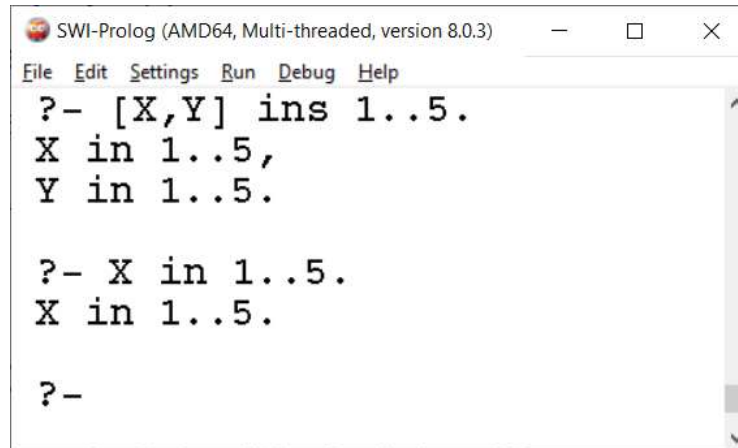

?- X #> 0, X #< 3.
X in 1..2.

?- X #> 0, X #< 3, indomain(X).
X = 1 ;
X = 2.
  
```

## Domain and labeling

- Built-in predicate **domain(L, Min, Max)** means all the variables in List L have domains Min..Max.
- Built-in predicate **labeling(Options, L)** generates concrete possible values of variables in list L.
  - Here Options variable is a list of options regarding the order in which variables in L are labelled.
  - If Options = [ ] then by default the variables **are labelled from left to right, taking the possible values one by one from smallest to largest.**
- label: equivalent to labeling([ ], Vars).

## Specifying range of numbers (in/ins arity 2)

```

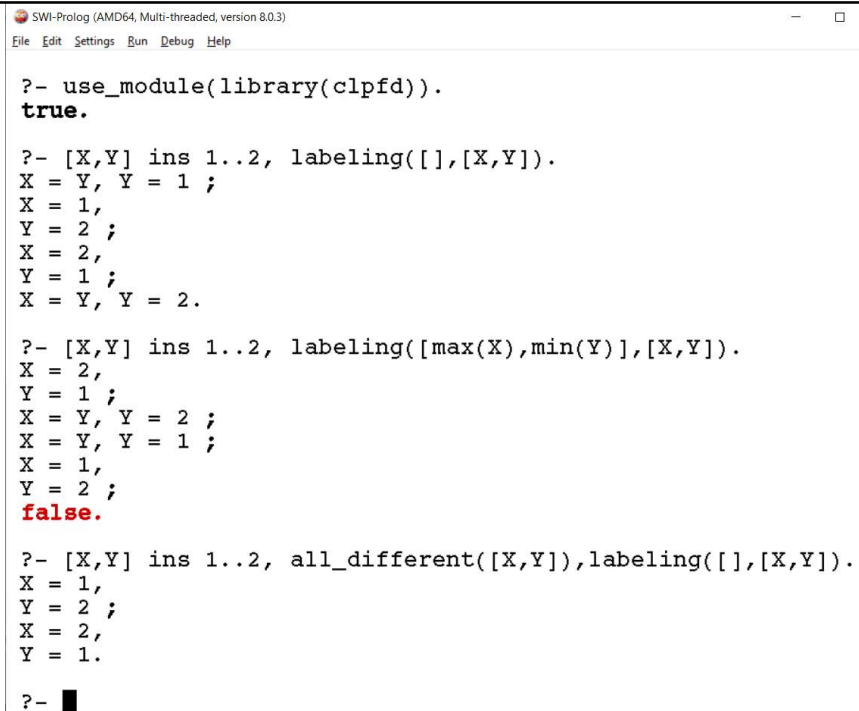

SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)
File Edit Settings Run Debug Help
?- [X,Y] ins 1..5.
X in 1..5,
Y in 1..5.

?- X in 1..5.
X in 1..5.

?-

```

labeling  
demo

```

SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)
File Edit Settings Run Debug Help
?- use_module(library(clpfd)).
true.

?- [X,Y] ins 1..2, labeling([], [X,Y]).
X = Y, Y = 1 ;
X = 1,
Y = 2 ;
X = 2,
Y = 1 ;
X = Y, Y = 2.

?- [X,Y] ins 1..2, labeling([max(X),min(Y)], [X,Y]).
X = 2,
Y = 1 ;
X = Y, Y = 2 ;
X = Y, Y = 1 ;
X = 1,
Y = 2 ;
false.

?- [X,Y] ins 1..2, all_different([X,Y]), labeling([], [X,Y]).
X = 1,
Y = 2 ;
X = 2,
Y = 1.

?-

```

## label

- The builtin predicate label is same as labeling but it takes just one parameter and does not provide any order for variable assignment.

?- X#>3, X#<6, Y#=X+5, label([Y]).

```
SWI-Prolog (AMD64, Multi-threaded, version 8.0.3)
File Edit Settings Run Debug Help

?- X#>3, X#<6, Y#=X+5, label([Y]).
X = 4,
Y = 9 ;
X = 5,
Y = 10.

?- 
```

## Solving puzzle SEND+MORE=MONEY

```
:- use_module(library(clpfd)).
puzzle([S,E,N,D] + [M,O,R,E] =
[M,O,N,E,Y]) :-
    Vars = [S,E,N,D,M,O,R,Y],
    Vars ins 0..9,
    all_different(Vars),
    S*1000 + E*100 + N*10 + D +
    M*1000 + O*100 + R*10 + E #=
M*10000 + O*1000 + N*100 + E*10 + Y,
    M #\= 0, S #\= 0.
```

➤ Sample queries for puzzle.

```
?- puzzle(As+Bs=Cs),
    label(As).
```

Or we can try just labelling one variable:

```
?- puzzle([S,E,N,D] +
[M,O,R,E] = [M,O,N,E,Y]),
    label([N]).
```

```
?- puzzle([S,E,N,D] +
[M,O,R,E] = [M,O,N,E,Y]),
    label([E]).
```

% d:/prolog2020/crypt\_arith.prolog compiled 0.00 sec, 2 clauses

## Output of Cryptarithmic puzzle

?- puzzle(As+Bs=Cs), label(As).

As = [9, 5, 6, 7],

Bs = [1, 0, 8, 5],

Cs = [1, 0, 6, 5, 2] ;

false.

?- puzzle([S,E,N,D] + [M,O,R,E] = [M,O,N,E,Y]), label([N]).

S = 9,

E = 5,

N = 6,

D = 7,

M = 1,

O = 0,

R = 8,

Y = 2 ;

false.

?- puzzle([S,E,N,D] + [M,O,R,E] = [M,O,N,E,Y]), label([E]).

S = 9,

E = 5,

N = 6,

D = 7,

M = 1,

O = 0,

R = 8,

Y = 2 ;

false.

## Built-in predicate append with arity 2

- **append(ListOfLists, List):** Concatenate a list of lists.
  - Is true if *ListOfLists* is a list of lists, and *List* is the concatenation of these lists.
  - Used to change collection of 1D lists into a 2D list/Matrix.

- **transpose(Matrix, Transpose):** Transpose a list of lists of the same length.

Example:

?- transpose([[1,2,3],[4,5,6],[7,8,9]], Ts) .

Ts = [[1, 4, 7],

[2, 5, 8],

[3, 6, 9]] .

## Built-in predicate length /2

- **length(*List*, *Int*)**
  - True if *Int* represents the number of elements in *List*.
- This predicate is a true relation and can be used to find the length of a list or **produce a list (holding variables) of length *Int***.
- The predicate is non-deterministic, producing lists of increasing length if *List* is a *partial list* and *Int* is unbound.
- It raises errors if
  - *Int* is bound to a non-integer.
  - *Int* is a negative integer.
  - *List* is neither a list nor a partial list. This error condition includes cyclic lists.
- **same\_length(*List1*, *List2*)**: is true when *List1* and *List2* are lists with the same number of elements.
  - The predicate is deterministic if at least one of the arguments is a proper list.
  - It is non-deterministic if both arguments are partial lists.

## maplist / 2

- True if *Goal* is successfully applied on all matching elements of the list.
- The maplist family of predicates is defined as:
 

```
maplist(P, [X11,...,X1n], ..., [Xm1,...,Xmn]) :-  
P(X11, ..., Xm1), ... P(X1n, ..., Xmn).
```
- This family of predicates is deterministic iff *Goal* is deterministic and *List1* is a proper list, i.e., a list that ends in [].

```
:- use_module(library(clpfd)).
```

## Solving Sudoku

```
sudoku(Rows) :-
```

```
length(Rows, 9),
```

```
    maplist(same_length(Rows), Rows),
```

```
    append(Rows, Vs), Vs ins 1..9,
```

```
    maplist(all_distinct, Rows),
```

```
    transpose(Rows, Columns),
```

```
    maplist(all_distinct, Columns),
```

```
    Rows = [As,Bs,Cs,Ds,Es,Fs,Gs,Hs,Is],
```

```
    blocks(As, Bs, Cs),
```

```
    blocks(Ds, Es, Fs),
```

```
    blocks(Gs, Hs, Is).
```

```
blocks([], [], []).
```

```
blocks([N1,N2,N3|Ns1], [N4,N5,N6|Ns2],
```

```
[N7,N8,N9|Ns3]) :-
```

```
    all_distinct([N1,N2,N3,N4,N5,N6,N7,N8,N9]),
```

```
    blocks(Ns1, Ns2, Ns3).
```

```
?-problem(1, Rows), sudoku(Rows), maplist(writeln, Rows).
```

```
problem(1,
[[_,_,_,_,_,_,_,_,_],
[_,_,_,_3,_,8,5],
[_,_1,_,2,_,_,_,_],
[_,_5,_,7,_,_,_,_],
[_,_4,_,_,_,1,_,_],
[_9,_,_,_,_,_,_,_],
[5,_,_,_,_,_,7,3],
[_,_2,_,1,_,_,_,_],
[_,_4,_,_,_,9]]).
```

```
:- use_module(library(clpfd)).
```

## Sudoku matrix

```
sudoku(Rows) :-
```

```
length(Rows, 9),
```

```
maplist(same_length(Rows), Rows),
```

```
    append(Rows, Vs), Vs ins 1..9,
```

```
    maplist(all_distinct, Rows),
```

```
    transpose(Rows, Columns),
```

```
    maplist(all_distinct, Columns),
```

```
    Rows = [As,Bs,Cs,Ds,Es,Fs,Gs,Hs,Is],
```

```
    blocks(As, Bs, Cs),
```

```
    blocks(Ds, Es, Fs),
```

```
    blocks(Gs, Hs, Is).
```

```
blocks([], [], []).
```

```
blocks([N1,N2,N3|Ns1], [N4,N5,N6|Ns2], [N7,N8,N9|Ns3]) :-
```

```
    all_distinct([N1,N2,N3,N4,N5,N6,N7,N8,N9]),
```

```
    blocks(Ns1, Ns2, Ns3).
```

```
?-problem(1, Rows), sudoku(Rows), maplist(writeln, Rows).
```

As	X <sub>N1</sub>	X <sub>N2</sub>	X <sub>N3</sub>	N1'	N2'	N3'	N1''	N2''	N3''
Bs	N4	N5	N6	N4'	N5'	(3)N6'		8	5
Cs	N7	N8	(1)N9	N7'	(2)N8'	N9'
